

# Usability Study Report for ReadIT

Date: 12th April 2026

Author: Kunj Joshi, Nina Jordan

## Application scope

**Project Name:** READit – Swipe your way through posts you like

**Description:** READit is a social media platform for people who like to voice their opinions on a topic and hear about other people's opinions on the topic as well. READit aims at being a healthy conversation place where people can discuss their opinions and send likes or dislikes to opinions they agree/disagree on. All kind of posts and comments would be anonymous. Similar posts would be accumulated under a channel and the posts liked by a user will appear under their personal channel later down the line.

**URL:** <https://rea-dit.vercel.app/login>

### Members:

- **Nina** - Channels – including User Homepage as a channel (Create Channels, View/Browse Channels, Homepage Collection, Channel Listing)
- **Kunj** - Posts and Comments Story (Create Posts, View Posts in a Channel, Create Comments, Delete Posts, Delete Comments)

### User Personas:

1. **James** – Someone who likes discussing topics online and would like to post his opinions and see how many people agree/disagree with him.
2. **Kevin** – Someone who likes reading through other people's opinions and would like to validate people with matching thoughts or criticize wrongful or hateful opinions.
3. **Pauline** – As a person who likes reading through different posts and like or dislike a post.
4. **Luna** – Someone who likes discussing her opinions with other people by commenting on their posts or inciting deeper conversations.

### User Stories:

**Nina:**

#### Channels:

- As a user, I want to view a list of available channels organized by interests.
- As a user, I want to create a new channel for my specific interests.
- As a user, I want to click on a channel and view the posts inside it.

**Kunj:**

#### Post & comments

- As a user, I want to create a post inside a selected channel.
- As a user, I want to browse posts within a channel and like/dislike those posts based on my personal opinions.
- As a user, I want to open a post and read its full thread.

- As a user, I want to comment on a post to join the discussion.
- As a user, I want to view comments under a post in a forum-style format. (edited)

# Experiment

## Preparation

### Introduction

The experiment is divided into three stages, where each stage provides insights into what can be improved in the application and how we can optimize certain features. The stages are as follows:

1. Introduction and Demographics
2. Task Set and User Execution
3. Final Feedback

We do not provide any kind of details into what the tasks are, what the application is and what the users are expected to do. At this point, the data that users have is the name of the application and that they are joining the Zoom Meeting to conduct a Usability Study. Please note that we wanted to include a maximum range of demographics from the target audience. Our target audience ideally lies in the age range of 20 - 30 years old and we want them to be of all backgrounds, i.e. people with technical backgrounds, non-technical backgrounds as well as people who do not utilize social media a lot and people who are online for majority of their time. This variety will be further explored in the Participant Section.

The breakdown of each stage is as follows:

### Stage 1: Introduction and Demographics

The introduction phase just includes gathering demographic data from the user as well as provide an overview of what a Usability Study is. We encourage our users to think out loud about what they are doing as well as communicate with the Study Organizer if they feel stuck somewhere. Please note that some users may not be able to think out loud properly, as they may not have the habit of doing so or the experience of doing the same.

We gather four demographics questions as we believe that covers a majority of the background we need to know for our users:

- **Name of participant**
- **Age of participant**
- **Occupation of participant**
- **Location of participant**

### Stage 2: Task Set and User Execution

The Usability Study is carried out by providing a fixed set of tasks to users and asking them to accomplish them. We encourage our users to think from an app user perspective to gain as much information about the usability as possible. Our goal is also to cover all possible interactions that a user can have on the application. We also attach a screenshot of the final stage of what the application should look like after execution of each successful task.

**1. Task 1: As a new user on this social media platform, you want to register and login to the application**

**Metrics of Success:**

Users register a new account using their Name, a Username and password and logs in to the homepage.

**Data to be observed:**

- How easily is a user able to locate the Register Page?
- Can the user identify the anonymity criteria that READit wants to promote?
- What is the user's intuition of the landing page and the registration page?
- What is the user's intuition for the next page after creating the account?
- Is there any UI Element that is missing which would have made their life easier or any UI Element that makes their experience more clunky?

**2. Task 2: As a user, you want to interact with other people's opinions**

**Metrics of Success:**

The User likes/dislikes a post from the homepage, comments on a post, likes the post from Post Modal, likes a comment and successfully closes the Post Modal to go back to the homepage.

**Data to be observed:**

- Is a user able to identify all possible interactions on the Homepage? A successful interaction scenario would be where the user would be able to like a post, dislike a post, comment on a post and like a comment.
- How intuitive is the meaning of liking and disliking a post?
- How helpful is the UI for the user to guide them in successfully completing all user interactions?
- Is there something that the users feel is missing on the homepage or would like to improve?
- Is there any UI Element that is missing which would have made their life easier or any UI Element that makes their experience more clunky?

**3. Task 3: As a <CHARACTER>, you want to find a place where you can share common opinions about something that you are passionate about**

**Metrics of Success:** The user finds the channel that we want them to find from the Channel Sidebar or creates a new channel for the Generalization provided.

**Data to be observed:**

- Is the user able to easily distinguish between the concepts of channels and posts?
- Can the user identify a channel where all common opinions would be posted?
- What is the user's intuition about a channel and what would the user do if the channel is missing?

- Can the user create a new channel for the <CHARACTER> Generalization?
  - Would the user be able to find posts and interact with them in the channel provided?
  - Is there any UI Element that is missing which would have made their life easier or any UI Element that makes their experience more clunky?
- Note: The <CHARACTER> changes for each participant. For e.g. <CHARACTER> becomes Hiker if the Reporter knows that their participant is an avid fan of hiking.**

**4. Task 4: As a user, you want to broadcast your opinion to people in general as well as to a fixed set of users who might relate to your opinion.**

**Metrics of Success:** The user first creates a post in Homepage and then creates a post in the channel allocated to them

**Data to be observed:**

- How easy is it to identify the create post button for different channels vs on Homepage?
- What is the user's intuition about the post they created?
- What is the user's intuition about the landing page after they created the post?
- Is there any UI Element that is missing which would have made their life easier or any UI Element that makes their experience more clunky?

**5. Task 5: As a user, you want to look at your interactions you have made in the past**

**Metrics of Success:** The user locates the Profile Page and makes an intuition of what they see on the profile page.

**Data to be observed:**

- How easily is the user able to identify the Profile Page Navigation?
- What is the user's intuition about the profile page?
- Is there somewhere else they might have liked to see the profile page?
- Is there something additional or missing on the profile page that limits their experience?
- Is there any UI Element that is missing which would have made their life easier or any UI Element that makes their experience more clunky?

**6. Task 6: As a separate new user to READit, you want to interact with the post you made earlier from your Homepage without navigating a channel.**

**Metrics of Success:** The user logs out from the current profile, registers a new profile, finds their post on the homepage and registers at least one interaction with the post.

**Data to be observed:**

- Can the user identify the logout procedure for the app?
- Can the user find the post they created earlier using a new account easily?
- What is their updated intuition about an interaction?

- Can the user identify an interaction (specifically a comment) that they have not made or made by a completely separate user that they do not know of?
- Is there any UI Element that is missing which would have made their life easier or any UI Element that makes their experience more clunky?

**Note: This task records the core experience of a Social Media application. We have artificially seeded comments that appear out of nowhere on the user's posts when they create a post. This is to simulate an anonymous user sharing their opinions on a user's post. We want to see the user's reaction as to whether they can identify such interactions or miss it out completely?**

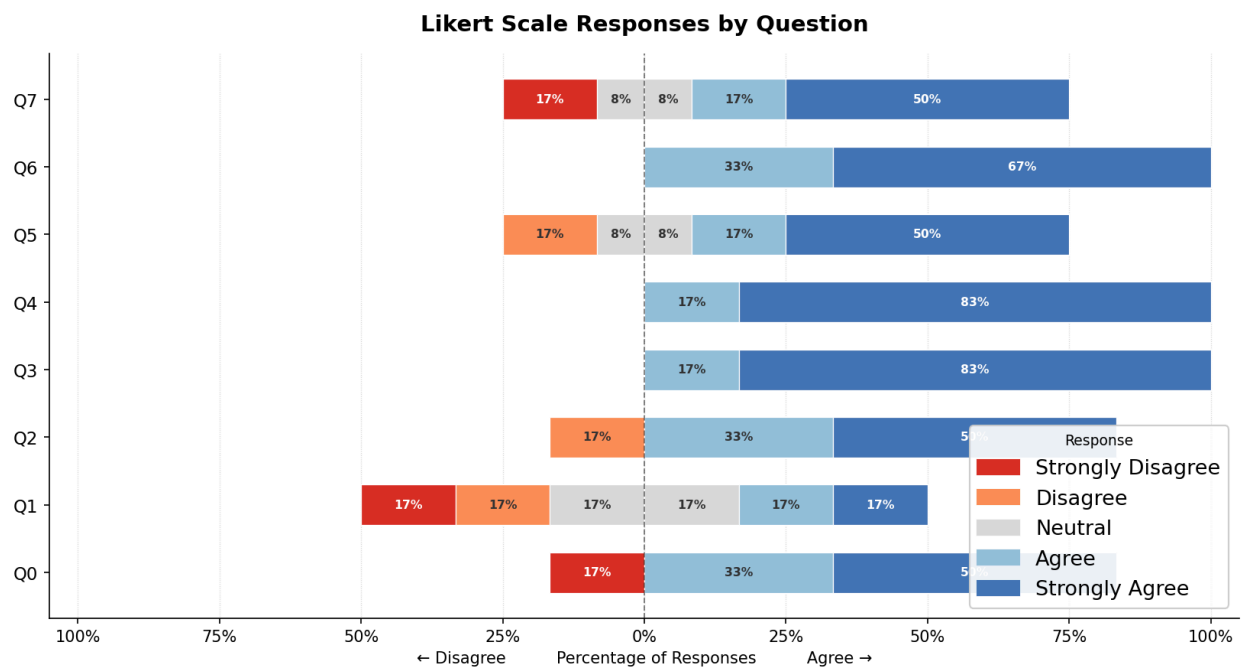

### **Stage 3: Final Feedback**

This stage allows the user for a free platform. The user can register interactions around the app and identify any bugs or difficulties that the tasks may not cover. This can also provide users with an opportunity to elaborate on issues they have identified or also provide with more issues that they can see forthcoming. Some users have also requested additional features that READit does not currently have such as Photo Upload for posts or Deletion of posts, which we will implement later down the line, but not prioritizing for the current usability study.

After the study is finished the user is provided with a Google Form (you can access here: <https://docs.google.com/forms/d/e/1FAIpQLSfCL2geY2qZihIN4PtFo5eORNVnsQ3Ep5K2yOZ3gDLiajoZw/viewform?usp=publish-editor> ) that concludes their experiment using a Likert Scale study. The questions asked in the Study are as follows:

- 1) It was easy to register an account and login to ReadIT after registration
- 2) It was intuitive to identify where the Profile Page on ReadIT is located at
- 3) The terminology of Posts and Channels makes it clear what ReadIT stands for and what you can expect with each click
- 4) It is easy to interact with other posts and comments such as Like or Dislike a Post or Comment
- 5) You could easily figure out where the Channels are located and how you can create a new Channel
- 6) It is intuitive that your liked posts appear on your Profile Page
- 7) It was easy to create a post in a channel
- 8) You would like to use this application again to view different people's opinion on something that you like

These 8 questions collect user feedback as well as additional feedback on how well the users feel the application has covered their requirements and how satisfied the users are with the application. Here is the Likert Scale graph of each of the questions:

**Fig 1: Likert Scale for Responses based on the Questions**

## Experiment Notes - Kunj Joshi

### Participant 1 - Devam Jariwala

**Study Conducted on: April 8th 2026**

**Recording Link:** [📺 Devam\\_Readit\\_usability.mp4](#)

Demographics answers:

- Name: Devam Jariwala
- Occupation: Software Engineer at Intuit
- Location: San Francisco, CA
- Age: 25

Detailed notes

#### Task 1:

- User found the registration page by clicking on the Register User on Login Page
- The user pointed out a lack of email address and phone number collection. Praised anonymity criteria promoted by READit.
- User was able to identify the difference between Registration Page and Login Page
- User compared the UI to Reddit's UI as well as Claude's UI
- User can identify the homepage with Post Stack after logging in
- The User felt that UI is self-intuitive. The instructions given on the page were enough to figure out how to use the pages and could predict what the next page would look like

#### Task 2:

- User liked, disliked and commented on a post. User also liked a post from Post Modal and identified a like mismatch ratio. User also liked a comment.
- User identified that liking a post means agreeing with the opinion of the post. Disliking means disagreeing with post.

- User felt that swiping on posts should be more intuitive. It adds to User Experience.
- The UI is intuitive enough for user to interact with posts.
- The user feels that homepage should be more filled in.

#### **Task 3:**

- We asked the user to create a new channel for Hiking. User created the channel fairly easily using the Create Channel button on Side Panel
- User feels that creating new channel should help them jump right into the channel
- User feels the concepts of Channels and Posts are well defined
- The user was able to find the channel for #News and interact with posts there.
- The user felt that the footer panel was helpful but too much work to find. The footer panel should be more accessible i.e. the user wants a straight forward way to jump into channels listing page.

#### **Task 4:**

- The user created a post successfully in #News channel as well as newly created #Hiking channel
- The user was able to find their post in channel as well as in Homepage.
- The user created a general post that appears in Homepage but not in Channels
- The user's intuition helped them create the posts easily.

#### **Task 5:**

- The user found it difficult to identify the Profile page.
- The user pointed out that Profile Banner on homepage was counter-intuitive and that the footer bar should not contain the profile button.
- The user identifies liked posts on Profile page.

#### **Task 6:**

- The logout button was fairly easy to locate
- The user followed steps in Step 1 to create a new account
- The user interacted with posts to find the post they created.
- The user easily identified the seeded comment and pointed it out.
- The user likes cross-account interaction aspect of the app

**Extra Feedback:** As a Software Engineer, this user provided a more detailed overview into READit. He suggested removing the entirety of Footer bar and dispersing its capabilities elsewhere on the website. It needs to be mentioned that as Devam is a Software Engineer, he also tends to think more from a developer perspective rather than a user perspective and therefore we believe his feedback here is valuable. We will be prioritizing it. The user would also like to post images to his posts using his READit account, but this becomes more of a feature request than usability enhancement.

#### **Post-test questionnaire results:**

- Q1: Strongly Disagree (1)
- Q2: Strongly Agree (5)
- Q3: Strongly Agree (5)
- Q4: Strongly Agree (5)
- Q5: Strongly Agree (5)

- Q6: Strongly Agree (5)
- Q7: Strongly Agree (5)
- Q8: Strongly Agree (5)

## **Participant 2 - Daksh Patel**

**Study Conducted on: April 9th, 2026**

**Recording Link:**  **Daksh\_Readit\_Usability.mp4**

Demographics answers:

- Name: Daksh Patel
- Age: 23
- Occupation: Masters of Science in Computer Science at Northeastern University
- Location: Boston, MA

Detailed notes

### **Task 1:**

- User found the registration page by clicking on the Register User on Login Page
- The user pointed out a lack of email address and phone number collection. Praised anonymity criteria promoted by READit.
- User was able to identify the difference between Registration Page and Login Page
- User wanted a cleaner UI with the Post Stack and believed that a Grid or a List Structure might be better suited
- The User felt that UI is self-intuitive. The instructions given on the page were enough to figure out how to use the pages and could predict what the next page would look like

### **Task 2:**

- User liked, disliked and commented on a post. User also liked a post from Post Modal. User also liked a comment. User wants a way to dislike a comment as well i.e. disagreeing with a commented opinion.
- User identified that liking a post means agreeing with the opinion of the post. Disliking means disagreeing with post.
- User felt that they should only be able to register one interaction with a post i.e either like or dislike a post.
- The UI is intuitive enough for user to interact with posts.

### **Task 3:**

- We asked the user to create a new channel for Sports. User created the channel fairly easily using the Create Channel button on Side Panel
- User liked the concept of Channels Listing page and were able to find the channel they created.
- User feels the concepts of Channels and Posts are well defined
- The user was able to find the channel for #General and interact with posts there.
- The user identified that the footer panel is counter-intuitive and that they would prefer a much more direct way of navigation.

### **Task 4:**

- The user created a post successfully in #General channel as well as newly created #Sports channel
- The user was able to find their post in the channel as well as in the Homepage.

- The user created a general post that appears in Homepage but not in Channels
- The user found it difficult to segregate post creation in Homepage vs in Channels. The user would prefer a more informative way of doing so instead of clicking on Create and gambling as to where the post would be made.

#### **Task 5:**

- The user found the profile page easily from Footer Bar.
- The user felt that Profile Banner on Homepage should be interactive.
- The user identifies liked posts on Profile page.

#### **Task 6:**

- The logout button was fairly easy to locate
- The user followed steps in Step 1 to create a new account
- The user interacted with posts to find the post they created.
- The user easily identified the seeded comment and pointed it out.
- The user likes cross-account interaction aspect of the app

**Extra Feedback:** The user felt that certain aspects of the app should be highlighted more than currently being done for e.g. the anonymous name tag provided by READit to users on random. The user also feels that certain form metrics should be constrained or made mandatory to fill in for e.g. Descriptions when creating Channels. As the second feedback was also provided by another of our users, we would try to implement it, but we are not prioritizing the first feedback.

Post-test questionnaire results (Likert scales):

- Q1: Strongly Agree (5)
- Q2: Neutral (3)
- Q3: Agree (4)
- Q4: Strongly Agree (5)
- Q5: Strongly Agree (5)
- Q6: Strongly Agree (5)
- Q7: Strongly Agree (5)
- Q8: Agree (4)

#### **Participant 3 - Sonia Purohit**

**Study Conducted on: April 12, 2026**

**Recording Link:** 📺 [Sonia\\_Readit\\_Usability.mp4](#)

Demographics answers:

- Name: Sonia Purohit
- Age: 25
- Occupation: Nurse at UMass Worcester Memorial Hospital
- Location: Grafton, MA

Detailed notes

#### **Task 1:**

- User found the registration page by clicking on the Register User on Login Page
- The user pointed out a lack of email address and phone number collection. Praised anonymity criteria promoted by READit.

- User was able to identify the difference between Registration Page and Login Page
- User found it difficult to identify their own anonymous name and mistakenly considered the Post Stack to be their data. User felt that text length restrictions would potentially be more informative for new users.
- The User felt that UI is self-intuitive but requires more instructions on the page to understand what needs to be done.

#### **Task 2:**

- User liked, disliked and commented on a post. User also liked a post from Post Modal. User also liked a comment. User wants a way to dislike a comment as well i.e. disagreeing with a commented opinion.
- User identified that liking a post means agreeing with the opinion of the post. Disliking means disagreeing with post.
- User felt that they should only be able to register one interaction with a post i.e either like or dislike a post.
- The UI is intuitive enough for user to interact with posts.

#### **Task 3:**

- We asked the user to create a new channel for Nursing. User created the channel fairly easily using the Create Channel button on Side Panel
- User believe that they should be jumped right into the channel they created rather than on channel listings page.
- User feels the concepts of Channels and Posts are well defined
- The user was able to find the channel for #General and interact with posts there.
- The user feels the Footer panel can be removed and the things provided there could exist in better positions across the UI.

#### **Task 4:**

- The user created a post successfully in #General channel as well as newly created #Nurse channel
- The user had difficulties in locating the Create post button in Footer Panel and required assistance from Study Organizer to help her locate the button.
- The user created a post in #Nurse channel. The user feels that after creating the post in a channel, they should remain in the channel and not go back to homepage.
- The user created a general post that appears in Homepage but not in Channels
- The user found it difficult to segregate post creation in Homepage vs in Channels. The user feels that the buttons need to be more prominent in order to identify them and carry out post creation.

#### **Task 5:**

- The user found the profile page easily from Footer Bar.
- The user felt that Profile Banner on Homepage should be interactive.
- The user identifies liked posts on Profile page.
- The user also suggested using more information such as posted content and commented content on Profile page.

#### **Task 6:**

- The logout button was fairly easy to locate

- The user followed steps in Step 1 to create a new account
- The user found it counter intuitive to have to interact with posts to identify posts they created. The user wanted a way to skip a post if they do not want to read it.
- The user missed out the seeded comment and required prompting from the study organizer to identify it.
- The user likes cross-account interaction aspect of the app

**Extra Feedback:** The user feels that they should be able to delete their posts once created. This allows for complete Social Media interaction. This particular feature is not implemented in READit and due to time constraints, we tend to not prioritize it. The user liked the concept of complete anonymous posting as well as a dating app style post interaction which no other social media platform does. The user also had concerns about bot traffic as we do not verify our users using email addresses or phone numbers. Again due to time constraints, we are not prioritizing this feature.

Post-test questionnaire results (Likert scales):

- Q1: Strongly Agree (5)
- Q2: Neutral (3)
- Q3: Agree (4)
- Q4: Strongly Agree (5)
- Q5: Strongly Agree (5)
- Q6: Agree (4)
- Q7: Agree (4)
- Q8: Strongly Agree (4)

Experiment Notes: Nina Jordan

## Experiment Notes: Summarized General issues

- All 3 participants said they would not use the app because of the color scheme
- Change font per rubric
- All usability issues resolved around profile and footer
- Move footer to the top as its hidden and confusing at bottom
- profile either on the bottom or smaller on the top and profile should be clickable
- Get rid of triangle buttons for swiping that doesn't work
- Something to tell the user they are on the homepage
- add icon of home to homepage, participants were confused about if they had navigated successfully to the homepage but they had
- One user thought channel page and channels on side bar was redundant

**Participant 1 – Sherrilyn Jordan**

**Study Conducted on: April 13th 2026**

**Recording Link:** <https://youtu.be/s-Zup01X3MY>

**Demographics answers:**

- Occupation: Retired Science teacher

- Location: Greenville, MS
- Age: 79

Detailed notes: user pulls up readit page and then immediately minimize it to which the sider bar then dominates flow and the page and user is confused on how to direct the page.

#### **Task 1:**

- User found the registration page by clicking on the Register User on Login Page
- User had some difficulty distinguishing the difference between Registration Page and Login Page
- User didn't like the color
- User is able to navigate to the homepage
- The User felt that navigation was easy enough with normal difficulties she always experiences on websites.
- Task were completed in a timely manner

#### **Task 2:**

- User liked, disliked and commented on a post. User also liked a comment.
- User identified that liking a post means agreeing with the opinion of the post. Disliking means disagreeing with a post.
- User thought there were extra buttons that were helpful in inferring what she was supposed to do and the flow of the app but when clicked they did nothing. (The white arrow buttons on the left and right of the post.
- The UI is intuitive enough for users to interact with posts.

#### **Task 3:**

- User able to location new channel button and creat a new channel
- User found location of new channel after creation by using intuitive alphabetical channel list
- User feels the concepts of Channels and Posts are well defined
- The user was able to find the channel for #nature and interacted with its posts

#### **Task 4:**

- The user was able to find their post in the channel as well as in the Homepage.
- The user created a post on the Anon homepage
- The user created a channel housekeeping and was able to add a new post there without question, the user felt that it was since that when you create a post, the channel that you are posting too is listed above create post.

#### **Task 5:**

- The user found the profile page which they remembered from looking for the create post button
- The user liked that their liked posts were on the profile page, they didnt feel anymore content should be added to this view.
- The user appreciated minimal information about their account in theme with the Annon website

#### **Task 6:**

- User logs out easily

- The user followed steps in Step 1 to create a new account successfully
- The user interacted with posts to find the post they created on housekeeping
- The user found their comments and added more

#### **Post-test questionnaire results:**

- Q1: Agree (4)
- Q2: Disagree (2)
- Q3: Disagree(2)
- Q4: Agree (4)
- Q5: Strongly Agree (5)
- Q6: Disagree (2)
- Q7: Agree (4)
- Q8: Agree (4)

#### **Participant 2 - Blake Sanders**

**Study Conducted on: April 13h, 2026**

**Video :** <https://youtu.be/XE35cUOV6AI>

#### **Demographics answers:**

- Name: Blake Sanders
- Age: 31
- Occupation: Statistician
- Location: New York, New York

#### **Task 1:**

- User found the registration page by clicking on the Register User on Login Page
- The did not mistakenly enter details into login page
- User was able to identify the difference between Registration Page and Login Page
- User was unsure that this was the homepage and was searching around for it.
- The User automatically navigated to multiple channels and correctly guessed what the app was for without being notified.

#### **Task 2:**

- User liked, disliked and commented on a post. User also liked a post, User also liked a comment.
- User identified that liking a post means agreeing with the opinion of the post. Disliking means disagreeing with post.
- User felt that they should only be able to register one interaction with a post i.e either like or dislike a post.
- The user interacted with posts with ease

#### **Task 3:**

- We asked the user to create a new channel for road trips
- User liked the concept of Channels Listing page and were able to find the channel they created.
- User feels the concepts of Channels and Posts are well defined
- The user was able to find the channel for road trips and interact with posts there.

**Task 4:**

- The user created a post successfully in multiple channels
- The user was able to find their post in the channel as well as in the Homepage.
- The user created a general post that appears in Homepage but not in Channels
- The create button was mistaken for channels multiple times

**Task 5:**

- The user found the profile page easily from Footer Bar.
- The user said the profile banner was useless and should take us directly to the profile
- The user identifies liked posts on the Profile page.

**Task 6:**

- The logout button was found quickly
- The user able to make a new account for the second time.
- The user searched around and found their previously made post with ease
- The user found their post and enjoyed that the image they selected displayed on the channel homepage

**Post-test questionnaire results (Likert scales):**

- Q1: Strongly Agree (5)
- Q2: Agree (4)
- Q3: Strongly Agree (5)
- Q4: Strongly Agree (5)
- Q5: Strongly Agree (5)
- Q6: Neutral (3)
- Q7: Strongly Agree (5)
- Q8: Strongly Agree (5)

**Participant 3 – Ryan Irwin**

**Study Conducted on: April 13 2026**

**Recording Link: <https://youtu.be/4VHETM-rfal>**

**Demographics answers:**

- Name: Ryan Irwin
- Age: 24
- Occupation: Law Student at Fordham University
- Location: New York, New York

**Task 1:**

- User found the registration page by clicking on the Register User on Login Page wasnt confused about log in vs register
- user did point out what is the point of the name vs username
- User found their own profile quickly
- The User felt that the homepage was obvious but unwelcoming, user also comments color scheme is neutral but not inviting at all.

**Task 2:**

- User liked, disliked and commented on a post.

- User identified that liking a post means agreeing with the opinion of the post. Disliking means disagreeing with post.
- User was confused by swiping and arrow buttons
- The UI is intuitive enough for user to interact with posts.

**Task 3:**

- We asked the user to create a new channel , they immediately went to create post and thought they were creating a channel
- User found correct place to create a new channel and said oh it was at the top so whats this on the footer and was confused by this placement
- User feels the concepts of Channels and Posts are well defined
- The user was able to find the channel for multiple channel topics when asked and like and disliked posts there

**Task 4:**

- The user created a post successfully in the main homepage channel and their newly created channel
- The user had difficulties in locating the Create post button in Footer Panel and required assistance from Study Organizer to help her locate the button.
- The user created a post in #Nurse channel. The user feels that after creating the post in a channel, they should remain in the channel and not go back to homepage.
- The user created a general post that appears in Homepage but not in Channels
- The user found the channel page

**Task 5:**

- The user found the profile page easily from Footer Bar.
- The user felt that Profile Banner on Homepage should be interactive.
- The user identifies liked posts on Profile page.
- The user also suggested using more information such as posted content and commented content on Profile page.

**Task 6:**

- The logout button was fairly easy to locate
- The user followed steps in Step 1 to create a new account
- The user pointed out the lack of control on channel names , could end up being too many characters, misplaced #
- The user found their comment from the other around and interacted with it
- The user though if possible bot issues with no authentication

**Post-test questionnaire results (Likert scales):**

- Q1: Agree (4)
- Q2: Disagree (2)
- Q3: Strongly Agree (5)
- Q4: Strongly Agree (5)
- Q5: Strongly Agree (5)
- Q6: Strongly Agree (5)
- Q7: Strongly Agree (5)
- Q8: Neutral (3)

## Prioritized list of issues and corresponding changes:

We prioritize issues that our users have pointed out and will prioritize based on how important the change is for usability of the app. Certain feedbacks are not being prioritized because we believe that they do not improve the usability of the app or are more of feature requests.

### **Issue: Footer Bar Counter Intuitiveness**

Change: Disperse the applications of Footer Bar into buttons over the website which are easier to find and improves usability

Priority: Must

Was it implemented? Yes. Implemented by removing the footer bar entirely. We add an additional Channels button in Sidebar, making Sidebar our primary point of contact for Channel features. We introduce two new buttons, Create Post (in Homepage) and Create Post in this Channel (in Channel Page), which are more intuitive than the current Create Post button. We also convert the Profile Banner on Homepage into an interactive banner that takes our user to Profile Page.

**Implemented By: Kunj Joshi**

### **Issue: Profile Banner Interactivity Issues**

Change: The Users felt that an interactive Profile banner will improve their usability of the application. Rather than searching the Profile button in Footer Bar, they can directly go to Profile Page from Homepage using the Profile Banner.

Priority: Must

Was it implemented? Yes. We converted the (?) icon on Profile banner into an interactive Profile button that takes you to the profile page.

**Implemented By: Kunj Joshi**

### **Issue: Post Swipe not working**

Change: The Homepage suggests user should be able to swipe through posts to interact with them such as like or dislike a post. The Post Stack also suggests that a user should be able to interact using swipes.

Priority: Could

Was it implemented? No. We find it counter-intuitive to add a swipe functionality in a Web Application majorly used on Personal Computers.

### **Issue: Users unable to Skip posts**

Change: One of our users pointed out that they would like to skip through posts rather than being forced to interact. This functionality sounds important for increased usability

Priority: Must

Was it implemented? Yes. We removed the Comment button below the Post Stack and introduced a Skip button in its place. This button allows user to skip through a post and interact with next post.

**Implemented By: Nina Jordan**

**Issue: Not enough data being represented on Profile Page**

Change: Users pointed out that Profile page only contained Liked Posts. They would like to see more data such as Posts they made or posts they commented on their profile page.

Priority: Must

Was it implemented? Yes. For the sake of this project, we are also presenting Created Posts by the user on Profile page now.

**Implemented By: Kunj Joshi**

**Issue: Create Post button being confusing**

Change: The users felt that create post button in footer bar was counter intuitive because of its multi functionality i.e. being used to create a post in channel as well as creating post on Homepage.

Priority: Must

Was it implemented? Yes. We created two separate buttons as mentioned in Issue 1.

**Implemented By: Nina Jordan**

**Issue: Landing Page after Channel/Post Creation**

Change: The users pointed out that fixed general purpose pages after Channel/Post creation adds a layer of difficulty where they have to find the Channel/Post they just created. They should land on the created page instead.

Priority: Must

Was it implemented? Yes. We now take users to Created Channel page. For posts, if a Post was created in a Channel, you go to the channel page and if in Homepage, you go to the Homepage.

**Implemented By: Nina Jordan**

**Issue: Minimum Characters and Form Filling Restrictions**

Change: Our users found some posts confusing due to them being of limited characters. One user also pointed out their difficulty to identify the Homepage due to small character posts

Priority: Must

Was it implemented? Yes. We have minimum character restrictions and form restrictions in place for certain forms.

**Implemented By: Kunj Joshi**

**Issue: Users unable to identify they correctly navigated to Homepage**

Change: Users were instructed to navigate to the homepage and did successfully but once there were confused and didn't understand what the homepage was. Same issue with the profile page- Need to add landmarks on homepage and profile page for identification.

Priority: Must

Was it implemented? Yes. Colors will be changed to something users find more pleasing

**Implemented By: Nina Jordan**

**Issue: Color scheme \***

Change: Users thought the black and orange color scheme made it feel like halloween and was displeasing to the eye. I think a softer color like blue or green with white or extremely light colored background for text and main page, tool bar/ profile/ header should be light in color and all variations on a theme

Priority: Must

Was it implemented? Yes. Colors will be changed to something users find more pleasing

**Implemented By: Nina Jordan**

**Issue: Comment should be disliked**

Change: One of our users also wanted to interact with comments by disliking them as they disagreed with the comment's opinion.

Priority: Could

Was it implemented? No. If we introduce a dislike button for comments, the UI becomes too clunky to use. We did not implement this feature.

**Issue: Post Deletion**

Change: One of our users pointed out their inability to delete posts and believe that post deletion should be possible for complete social media interaction.

Priority: Should

Was it implemented? Yes. We allow Post Deletion for users who have created the post. You can go to your profile page and open a post and you will see the delete button there.

**Implemented By: Kunj Joshi**

**Issue: Photo Upload**

Change: One of our users also pointed out their inability to upload photos or videos on READit and would prefer doing so.

Priority: Would

Was it implemented? No. We chose to not implement this feature due to its complexity of implementation.

**Issue: No Bot Verification**

Change: One of our users showed concern about bot-farming on READit due to no verification policy. They believe that their usability would be hindered if READit was overwhelmed by bots.

Priority: Would

Was it implemented? No. We chose to not implement this feature due to its complexity of implementation.

**Issue: Channel view and Channel side bar view redundancy**

Change: With limited channels and posts as this is a prototype, the channels in the side bar match exactly to the "channel page view.

Priority: Would

Was it implemented? No. This is only an issue with the small data set, once more objects added their will be clear differences in which channels appear on homepage vs only channel page
